Sample Basic Physics Questions for Competitive Exams

Practicing sample questions helps in understanding the exam pattern and improving problem-solving skills. Here are some typical questions categorized by topic:

Mechanics

- **Question:** A car accelerates uniformly from a speed of 20 m/s to 40 m/s in 10 seconds. What is the acceleration of the car?

- **Solution:** Using the formula for acceleration, $(a = \frac{\Delta v}{\Delta t} = \frac{40 - 20}{10} = 2 \text{ m/s}^2)$.

Thermodynamics

- **Question:** An ideal gas is compressed isothermally. How does the pressure change with volume?

- **Answer:** According to Boyle's Law, $(PV = \text{constant})$. As volume decreases, pressure increases proportionally.

Electromagnetism

- **Question:** What is the force between two point charges of 3 μC and 2 μC separated by a distance of 4 meters? (Use Coulomb's Law, $(F = k \frac{|q_1 q_2|}{r^2})$, where $(k = 9 \times 10^9 \text{ Nm}^2/\text{C}^2)$)

- **Solution:** $(F = 9 \times 10^9 \times \frac{3 \times 10^{-6} \times 2 \times 10^{-6}}{4^2} = 9 \times 10^9 \times \frac{6 \times 10^{-12}}{16} = 3.375 \times 10^{-3} \text{ N})$.

Waves and Optics

- **Question:** Light passes from air into water at an angle of 30° . If the refractive index of water is 1.33, what is the angle of refraction?

- **Solution:** Using Snell's Law, $(n_1 \sin \theta_1 = n_2 \sin \theta_2)$. Assuming $(n_1 = 1)$ (air), $(\sin \theta_2 = \frac{\sin 30^\circ}{1.33} = \frac{0.5}{1.33} \approx 0.376)$. Therefore, $(\theta_2 \approx 22^\circ)$.

Modern Physics

- **Question:** The work function of a metal is 2 eV. If light of wavelength 400 nm strikes the metal surface, will the photoelectric effect occur?

- **Solution:** The energy of incident photons: $(E = \frac{hc}{\lambda} = \frac{1240 \text{ eV}\cdot\text{nm}}{400 \text{ nm}} = 3.1 \text{ eV})$. Since $3.1 \text{ eV} > 2 \text{ eV}$, electrons will be emitted, and photoelectric effect occurs.

Deep Dive into Key Physics Questions and Concepts

Let's explore some fundamental questions, their concepts, and problem-solving techniques for each topic.

Motion and Mechanics

Q1: What is the difference between uniform and non-uniform motion? How do you calculate average velocity?

Concept:

- Uniform motion involves constant velocity; the object covers equal distances in equal intervals.
- Non-uniform motion involves changing velocity.

Solution Approach:

- Average velocity is calculated as total displacement divided by total time:

\[

$$v_{\text{avg}} = \frac{\text{Total Displacement}}{\text{Total Time}}$$

\]

Q2: State Newton's Laws of Motion and give an example of each.

Newton's First Law:

An object remains at rest or moves uniformly unless acted upon by an external force.

Example: A book lying on a table remains at rest unless pushed.

Newton's Second Law:

Force equals mass times acceleration ($F=ma$).

Example: Pushing a cart increases its speed proportionally to the applied force.

Newton's Third Law:

For every action, there is an equal and opposite reaction.

Example: When you jump, ground pushes back with equal force.

Q3: Derive the work-energy theorem.

Concept:

Work done on an object results in a change in its kinetic energy.

Derivation:

- Work done (W) = force (F) $\times$ displacement (s)
- When ($F=ma$), work becomes ($W=ma s$).
- Kinetic energy ($KE=\frac{1}{2} mv^2$).
- The theorem states: ($W = \Delta KE$).

Implication:

Applying force over a distance accelerates the body, increasing its kinetic energy.

Thermodynamics

Q4: State and explain the First Law of Thermodynamics.

Answer:

The energy of an isolated system remains constant. The change in internal energy (ΔU) equals heat added (Q) minus work done (W):

[

$$\Delta U = Q - W$$

]

Application:

In a process where heat is added to a gas, the internal energy increases unless work is done by the gas.

Q5: What is the efficiency of a Carnot engine? How is it calculated?

Concept:

The maximum efficiency possible between two temperature reservoirs:

\[

$$\eta = 1 - \frac{T_{\{C\}}}{T_{\{H\}}}$$

\]

where $(T_{\{H\}})$ and $(T_{\{C\}})$ are the absolute temperatures of the hot and cold reservoirs.

Significance:

Understanding Carnot efficiency helps in analyzing ideal heat engines and their limitations.

Waves and Oscillations

Q6: Derive the expression for the period and frequency of a simple pendulum.

Solution:

- Period $(T = 2\pi \sqrt{\frac{l}{g}})$, where (l) is the length of the pendulum and (g) is acceleration due to gravity.

- Frequency $(f = \frac{1}{T})$.

Note:

This formula assumes small oscillations.

Q7: What is simple harmonic motion (SHM)? State the conditions for SHM.

Answer:

SHM is periodic motion where the restoring force is directly proportional to displacement and acts in the opposite direction:

\[

$$F_{\text{restoring}} = -k x$$

\]

Conditions:

- Restoring force is proportional to displacement.
- Force acts toward the equilibrium position.
- The motion repeats periodically.

Electrodynamics

Q8: State Coulomb's Law and explain the significance of the electrostatic force.

Answer:

Coulomb's Law states:

\[

$$F = k \frac{|q_1 q_2|}{r^2}$$

\]

where k is Coulomb's constant, (q_1, q_2) are charges, and (r) is the distance between charges.

Significance:

Fundamental in understanding electric fields, forces between charges, and designing electrical devices.

Q9: How is the electric field due to a point charge calculated?

Answer:

Electric field (E) at a distance (r) from a point charge:

\[

$$E = \frac{F}{q} = k \frac{|Q|}{r^2}$$

\]

Direction is radially outward for positive charges and inward for negative charges.

Modern Physics

Q10: Explain the photoelectric effect and its significance.

Answer:

When light of sufficient frequency strikes a metal surface, electrons are emitted. The energy of ejected electrons depends on the frequency of incident light:

\[

$$E = h \nu - \phi$$

\]

Where (h) is Planck's constant, (ν) is the frequency, and (ϕ) is work function.

Significance:

Supported the quantum theory; demonstrated that light has particle-like properties.

Question What is Newton's first law of motion? Newton's first law states that an object at rest remains at rest and an object in motion continues in motion with the same speed and in the same direction unless acted upon by an external force. Define acceleration due to gravity. Acceleration due to gravity is the acceleration experienced by an object due to the gravitational pull of the Earth, typically denoted as 'g' and approximately equal to 9.8 m/s^2 near the Earth's surface. What is the principle of conservation of energy? The principle of conservation of energy states that energy cannot be created or destroyed; it can only be transformed from one form to another, but the total energy remains constant in an isolated system. How is power defined in physics? Power is defined as the rate at which work is done or energy is transferred, mathematically given by $\text{Power} = \text{Work done} / \text{Time taken}$. What is the difference between speed and velocity? Speed is the rate at which an object covers distance regardless of direction, whereas velocity is speed with a specified direction, making it a vector quantity. What is Hooke's Law? Hooke's Law states that the restoring force exerted by a spring is directly proportional to the displacement from its equilibrium position, expressed as $F = -kx$, where k is the spring constant and x is the displacement. Define work in physics. Work is said to be done when a force is applied to an object and the object moves in the direction of the applied force, calculated as $\text{Work} = \text{Force} \times \text{Displacement} \times \cos\theta$. What is the unit of electric current? The SI unit of electric current is the Ampere (A). Explain the concept of simple

harmonic motion. Simple harmonic motion is a type of periodic motion where the restoring force is directly proportional to the displacement and acts in the opposite direction, such as in a pendulum or a mass-spring system. What is the principle of moments? The principle of moments states that for an object in equilibrium, the sum of clockwise moments about any point equals the sum of counterclockwise moments about that point.
