Stereochemistry: Chiral Centers and Optical Activity

Understanding Chirality and Chiral Centers

Chirality is a cornerstone of stereochemistry, where molecules are non-superimposable on their mirror images. These molecules contain at least one chiral center, typically a carbon atom bonded to four different substituents.

Key aspects include:

- Identification of chiral centers
- R/S configuration assignment
- Chirality's impact on physical and chemical properties

Identifying Chiral Centers:

- Examine the carbon atoms in the molecule.
- Determine if the carbon is attached to four different groups.
- Mark such carbons as potential chiral centers.

Assigning R/S Configuration:

- Assign priorities to substituents based on atomic number (Cahn-Ingold-Prelog rules).
- Orient the molecule so the lowest priority group points away.
- Determine the sequence 1-2-3; clockwise indicates R, counterclockwise indicates S.

Optical Activity and Enantiomers

Enantiomers are pairs of stereoisomers that are non-superimposable mirror images. They exhibit optical activity, rotating plane-polarized light in opposite directions.

Characteristics:

- Enantiomers have identical physical properties except for their interaction with plane-polarized light.
- The d (dextrorotatory) enantiomer rotates light clockwise.
- The l (levorotatory) enantiomer rotates light counterclockwise.

Importance in Pharmaceuticals:

Enantiomeric purity is critical, as different enantiomers can have vastly different biological activities.

Reaction Mechanisms: Nucleophilic Substitution and Elimination

Understanding reaction mechanisms is fundamental in organic chemistry. Page 101 likely discusses typical mechanisms such as SN1, SN2, E1, and E2.

SN1 vs. SN2 Mechanisms

| Feature | SN1 | SN2 |

|-----|-----|-----|

| Rate-Determining Step | Formation of carbocation | Single concerted step |

| Substrate Preference | Tertiary > secondary > primary | Primary > secondary > tertiary (less favorable) |

| Stereochemistry | Racemization; possible inversion | Inversion of configuration (Walden inversion) |

| Nucleophile Strength | Weak nucleophiles | Strong nucleophiles |

SN1 Mechanism:

- Involves carbocation intermediate.
- Rate depends only on substrate concentration.
- Typical in tertiary alkyl halides.

SN2 Mechanism:

- One concerted step with backside attack.
- Rate depends on both substrate and nucleophile.
- Common with primary alkyl halides.

Elimination Reactions: E1 and E2

| Feature | E1 | E2 |

|-----|-----|-----|

| Mechanism | Carbocation intermediate | Concerted elimination |

| Conditions | Weak bases, tertiary substrates | Strong bases, primary or secondary substrates |

| Stereochemistry | Mixture of stereoisomers | Typically anti-periplanar |
