Publications often explore the measure-theoretic properties of fractals, bridging geometric intuition with rigorous quantitative

analysis.

- Minimal Surface Theory: The study of surfaces that minimize area under constraints is a classical GMT problem. SNS researchers have contributed to understanding the regularity and singularity theory of minimal surfaces, especially in higher codimensions.
- Rectifiable Currents and Varifolds: These generalized surfaces allow for the treatment of more singular objects. Publications analyze their structure, stability, and variational properties, often employing advanced tools such as Almgren's regularity theory and Federer-Fleming's theory.
- Quantitative Geometric Analysis: SNS scholars have employed GMT techniques to derive quantitative measures of geometric complexity, such as beta-numbers and Jones' traveling salesman theorem, to characterize the structure of irregular sets.

Notable Publications and Contributions

- Regularity Results for Varifolds: Researchers associated with SNS have published groundbreaking papers on the regularity of varifolds, advancing understanding of singularities and smoothness criteria.
- Fractal Geometry and Measures: Several influential works have analyzed the measure-theoretic dimension of fractals, providing new insights into their geometric complexity.
