Dear Dr. Doe,

RE: Referral for physiotherapy assessment and management of Mr. John Smith

I am writing to refer Mr. John Smith, a 45-year-old male, for physiotherapy assessment and ongoing management following a left ankle fracture sustained three months ago.

Patient Background and Presenting Complaints

Mr. Smith reports persistent swelling and discomfort in his left ankle, particularly when weight-bearing. He describes the pain as a dull ache rated 4 out of 10 on the pain scale, which increases with activity. He has experienced limited range of motion and difficulty walking without discomfort. There is no history of recent trauma or infection.

Clinical Findings

On examination, there is visible swelling around the lateral malleolus. Palpation reveals tenderness over the anterior ankle joint. Range of motion testing indicates dorsiflexion limited to 10 degrees (normal is approximately 20 degrees), and plantarflexion to 40 degrees. Strength testing shows 4/5 in dorsiflexion and plantarflexion. No signs of infection or skin abnormalities are observed. X-ray reports confirm healed fracture with residual joint stiffness.

Physiotherapy Assessment and Recommendations

Given the ongoing symptoms and reduced mobility, I recommend a comprehensive physiotherapy program focusing on:

- Pain management and swelling reduction through modalities such as ice and gentle mobilization.
- Range of motion exercises to restore joint flexibility.
- Strengthening exercises targeting ankle stabilizers.
- Gait training to improve walking efficiency.

Goals include reducing pain and swelling, increasing ankle mobility to at least 15 degrees of dorsiflexion, and restoring functional mobility for daily activities.

Please feel free to contact me should you require further information or discuss the patient's progress.

Yours sincerely,

Sample Physiotherapy OET Referral Letter: Breakdown and Analysis

While actual OET responses are personalized, analyzing a sample can illuminate effective strategies.

Sample Scenario Overview:

A 45-year-old male patient with persistent lower back pain following a lifting injury. You are a physiotherapist referring him to an orthopedic specialist.

Sample Extract:

Dear Dr. Smith,

I am referring Mr. John Doe, a 45-year-old male who has been experiencing persistent lower back pain for the past four weeks following a lifting incident at work. The pain is localized to the lumbar

region, rated 6/10 on the pain scale, and worsens with activity.

On examination, there is tenderness over the lumbar paraspinal muscles, decreased range of motion in flexion and extension, and slight muscle weakness in the lower limbs. No neurological deficits were observed. The patient reports difficulty performing daily activities and has been unable to return to work.

Initial physiotherapy interventions included pain management techniques, core strengthening exercises, and education on proper lifting techniques. The patient responded gradually to treatment, with a reduction in pain severity to 3/10 and improved mobility.

Given the ongoing symptoms and functional limitations, I recommend further assessment, possibly imaging, and consideration of specialist intervention. Continued physiotherapy focusing on functional restoration is advised.

Sincerely,

Jane Doe, MSPT
